SPECIFICATION AMENDMENTS

Marked-Up Version

Please **REPLACE** the third paragraph on page 3 with the following:

U.S. Patent No. 5,434,394 to Roach et al. (Roach) shows an automated order and delivery system wherein a point-of-sale computer system is enabled to cooperate with a warehouse computer system to facilitate the shopping, product delivery and check-out processes. In Roach, the point-of-sale system is used to develop, order and deliver[y] information at the point-of-sale[,] and transmit that information to the warehouse system. The warehouse system is then operated to facilitate fast product delivery and/or shipping. The purchase and delivery information is communicated to the check-out register to facilitate checkout. While facilitating in-store shopping, Roach does not enable a buyer to select from a wider selection of goods than is typical in a retail store environment.

Please **REPLACE** the last paragraph on page 3 which ends on page 4, with the following:

Retail stores are known wherein customers are invited to shop from catalogs, placing their orders for catalog goods through catalogs made available at the retail location. To the best knowledge of applicant, such stores operate by collecting customer orders through local point-of-sale systems, collecting funds directly from customers[,] and subsequently placing orders and making payments to the catalog merchants. As will be appreciated, the selection of catalogs from which a customer may select merchandise will likely be very limited to those provided by the retailer. Further, such a system requires that a customer travel to the store to browse catalogs and select goods.

Please **REPLACE** the last paragraph on page 7 which ends on page 8, with the following:

Referring now to Fig. 1, a retail system 10 is shown including a remote seller system 12 connected to a local point-of-sale (POS) system 14 through a remote processor system 16. These systems are suitably interconnected by data links 18, 20, comprising for example telephone connections or electronic network connections. A buyer system 22 is connected to remote seller system 12 by a suitable data link 24. In the present embodiment data link 24 comprises an Internet connection, for example a conventional world-wide-web browser, established through a telephone line. A plurality of point-of-sale (POS) terminals 26A, 26B, 26N[n] are connected to local POS system 14, for example through a conventional computer data network.

Please **REPLACE** the second paragraph on page 8 with the following:

As will be explained in further detail below, remote seller system 12 comprises a remote retail transaction processing system, in the present embodiment a computerized order processing system operated by a remote seller herein described as a catalog marketer. Local POS system 14 with POS terminals 26A-N[n] comprises a conventional, commercially available POS processing system. Remote processor system 16 comprises a conventional computer system connected and programmed to operate in accordance with the present invention, while buyer system 22 comprises a conventional home computer, again connected and programmed to implement the present invention.

Please **REPLACE** the last paragraph on page 8 with the following:

Through conventionally known apparatus (not shown), local POS system 14 is connected to operate with POS terminals 26A-N[n] and remote processor system 16.

Please **REPLACE** the third paragraph on page 14 with the following:

Referring now to Figs. 5A-B[b], a process is shown whereby a catalog merchant operates remote seller system 12 to receive a catalog order from a customer and

process that order to facilitate payment at local POS system 14. The process described herein includes the function of remote processing system 16 as an intermediary between the remote seller and the local retailer. While this embodiment is the preferred embodiment, it will be understood that the function of remote processing system 16 is optional: the system may be omitted in its entirety and replaced by direct communications between remote seller system 12 and local POS system 14.

Please **REPLACE** the first paragraph on page 19 with the following:

If no order record is identified including the received order code, then the remote seller system transmits an "invalid order code" or similar message to the remote processor system (step 308), which[who] in turn transmits a similar message to the local seller system (step 310). The local seller may then, for example, request from the customer another order number, or void the transaction.

Please **REPLACE** the third paragraph on page 19 with the following:

With reference now to Fig. 7B, upon receipt of payment from the buyer, the local POS system generates and transmits a payment verification message to the remote processor system (step 320), which[who] in turn receives the message and creates and stores a new record in merchant order database 78 (Fig. 3C) (step 322).

Please **REPLACE** the forth paragraph on page 19 with the following:

The remote processor system transmits a payment verification message to the remote seller system (step 324), which[who] then populates the date paid field 148 of order database 124 (Fig. 4B) with the receipt date of the payment verification (step 326). The remote seller system then initiates delivery of the goods to the buyer. aforementioned processing.
